AUTHOR: Ganetskiy, A.A., Engineer

TITLE: The Manufacture of Lens Compensators by Rolling with
a Roller in a Face Lathe

PERIODICAL: Energetik, 1959, Nr 6, pp 14-15 (USSR)

ABSTRACT: The Stalinogorskiy kotel'no mekhanicheskiy zavod
(Stalinogorsk Boiler-Mechanical Plant) of the trust
Tsentroneergomontazh has developed a new machine method
of manufacturing semi-lens compensators (Figure 1).
The rotating blank is held by the chuck of a face
lathe with the help of a mandrel and is rolled over by
a special roller. Blanks of semi-lenses of up to
800mm diameter are cut out of steel sheet, whereas
those of a larger diameter are welded together from 2-3
parts. The semi-lenses can be machined not only in a
face lathe but also in a boring and turning lathe with

Card 1/2

SOV/91-59-6-10/33

The Manufacture of Lens Compensators by Rolling with a Roller in a Face Lathe

sufficiently large face plate, and in a flange lathe with sufficient height of the points. The machining of blanks is performed at a rotation speed of $1\frac{1}{2}$ -2 m/sec, takes 2-3 minutes. The lens compensator is welded together from semi-lenses by electrical welding. The article contains a brief description of the machining operation. There are 4 sets of diagrams.

Title : Fixing of the Molecular Orientation in the Vulcaniza-
tion of Rubber

Orig Pub: Godishnik Khim-tekhmol in-t, 1955 (1956), 2, No 2,
137-149.

Abstract: The durability of vulcanization can be raised sub-
stantially if the batches of the rubber mixture are
first scorched and then stretched and vulcanized.
The increase in durability is explained by orienta-
tion, and by the subsequent fixation of the orientated

Card : 1/3

structure during vulcanization. Rubbers obtained by
vulcanization of crude stretched mixtures also show
an increase in durability (of 10%); however, the
effect appears substantially only if the mixtures
are scorched. Mixtures of rubber with low plastici-
ty show a high degree of orientation. The durability-
increase effect has a maximum dependent on the S con-
tent. In mixtures of NK (S 3%, 5 minutes of scorch-
ing, 20 minutes of vulcanization at 142°), with an
optimum elongation of 15%, the durability of a vulcan-
ized batch doubled in the direction of elongation, and
decreased 8% laterally. In addition, the relative len-
gthening at the break decreased by 35% in the direction

of elongation and increased by 13% laterally. The
drop of the scorching temperature from 142° to 60°,
and the simultaneous increase of vulcanization time
from 5 to 1200 minutes, contributed to the increase
in the durability of the rubbers. The effect of the
increase in durability during vulcanization with
elongation is observed in greater measure in NK than in
Na-butadiene rubber.

 Ganev, G. and Krastanov, L. *Prinos k'm meteorologichno izsledvane zasushavaniata*
 Bulgaria. [A contribution to the meteorological investigation of drought in Bulgaria.]
 Bulgarska Akademiia na Naukite, Sofia, *Izvestia, Ser. Fizicheska*, 2:255-280, Jan./Dec. 1951.
 13 figs., 5 maps (fold.), 2 tables, 8 refs. Russian and English summaries p. 269-272. DLC—
 Data for 50 evenly distributed stations in Bulgaria for the period 1896-1949 are analyzed to
 show frequency, duration and local distribution of drought in the various seasons. Drought
 is defined as a period of at least 10 days without precipitation. Drought occurs most fre-
 quently in autumn, then in summer, then winter and least often in spring. Composite isobaric
 charts are prepared for the most serious droughts. In several cases the main pressure
 systems are shown for several phases of the drought cycle. Several drought types are differentiated:
 (a) Extension of Azores anticyclone to cover Central Europe; (b) North Sea anticyclone
 extended forward to Balkans; (c) NE type with anticyclone over continental U.S.S.R.;
 (d) Combinations of these types. The SE plains along the Black Sea are the most subject to
 drought although other scattered areas show high frequency. Subject Headings: 1. Drought
 2. Synoptic conditions for drought Bulgaria.—M.R.

Krytenov, L. and Anev, G. A Bulgarian meteorological bulletin (One of the fields of meteorological research in Bulgaria.) *Idzdatk, Budapest*, 58(4) 373-379, Nov./Dec. 1954. 13 figs. Russian and French summaries p. 373. Trans. by Mrs. L. F. H. D.W. 1. Also complete German version: *Über die Richtung der bulgarischen meteorologischen Forschungen*. *Acta Aeronomica*, Budapest, 5(1/2):145-154, 1955. Russian and English summaries p. 154. DA. In studying the development of synoptic situations causing drought in Bulgaria it was found that the first step would be to investigate the stable anticyclonic situations. Anticyclonic influences causing severe drought in different seasons may be classified in four groups: 1) western (Arctic), 2) north-western (Arctic), 3) northeastern (Arctic) and 4) combined influences. Mapping of these synoptic processes has been found very useful in preparing long range forecasts. Subject Headings: 1. Synoptic conditions for drought 2. Drought forecasting 3. Bulgaria. 1. TITLE: The SO-1 neutron multiplier

SOURCE: Atomnaya energiya, v. 21, no. 4, 1966, 321-322

TOPIC TAGS: nuclear research reactor, thermal neutron, fast neutron, reactor neutron flux/ SO-1 neutron multiplier

ABSTRACT: The authors describe a neutron multiplier which they have developed to operate with thermal neutrons, having a rated power 0.5 watt, a neutron multiplication coefficient 0.997, maximum fluxes in the center of the active zone 2.5×10^7 and 7×10^7 neut/cm²-sec for thermal and fast neutrons, respectively, and a flux of 10^7 neut/cm²-sec at the locations where the experiments are performed. The fuel is uranium dioxide immersed in polyethylene, containing 900 g of U²³⁵ (36% enrichment) per load. The moderator is polyethylene, and the reflector is graphite combined with polyethylene. The individual units and the control of the multiplier are briefly described. Advantages claimed for the multiplier are ease of control, protection against nuclear accidents, transportability (can be transported with a 10-ton truck), and simple construction. Possible applications of the neutron multiplier are for geological prospecting, activation analysis of isotopes and other materials, and medical applications.

TITLE: Corrosion Resistance of "1Kh18N9T"-Steel Weld Joints in
Nitric Acid Production (Korrozionnaya stoykost' svarnykh
soyedineniy iz stali 1Kh18N9T v usloviyakh proizvodstva
azotnoy kisloty)

PERIODICAL: Avtomaticheskaya svarka, 1958, Nr 9, pp 61-73 (USSR)

ABSTRACT: Application of "1Kh18N9T" steel for equipment used in the
production of nitric acid requires welding processes pro-
ducing joints that are resistant against corrosion and inter-
crystalline corrosion and which is similar to that of the
base metal. For this purpose, natural corrosion tests of
"1Kh18N9T" steel specimens welded with different electrodes
under flux were carried out at the Chemical Combine imeni
Stalin at Dimitrovgrad (Bulgaria). It was proved that seams
welded with chromo-nickel-vanadium-niobium rods (OKh18N9FBS -
EI649) and chromo-nickel-vanadium rods (OKh18N9F2S - EI606),
have high corrosion and intercrystalline corrosion resistance
under conditions of nitric acid production and that cold
hardening by stretching, as well as by compression, increases

"Choice of Optimal Conditions for Diagnosis by Means of a Computer"

Sofia, Eksperimentalna Meditsina i Morfologiya, Vol 5, No 4, 1966, pp. 197-203

Abstract: A theoretical consideration of available methods for setting medical diagnoses by means of a computer led the authors to the conclusion that application of the formula of Beiss[?] (cf. R.S.Ledley, L. B. Lusted, Science, 130, 9-21 1959) or of the method of information coefficients leads to the most precise results. The method of information coefficients is convenient for mathematical modeling of information in a form in which it can be handled by a computer. By using this method, a correct diagnosis can also be made in the event that several diseases are present simultaneously. Six references (2 Bulgarian, 3 USSR, 1 Western). Russian and English summaries. Manuscript received Mar 66.

AUTHORS: Caneva, L. I.; Golyamina, I. P.

TITLE: Properties of magnetostrictive ferrites at high temperatures

SOURCE: Akusticheskiy zhurnal, v. 9, no. 4, 1963, 413-417

TOPIC TAGS: ferrite, magnetostriction, magnetostrictive ferrite, magnetostrictive ferrite temperature property, ultrasound transducer, mechanical stress measurement, magnetostrictive material

ABSTRACT: The temperature dependence essential for electro-acoustical transformation characteristics of magnetostrictive ferrites from room temperature to Curie point was investigated. The Curie point of several ferrites is tabulated; nickel ferrite 21 is shown to have the most stable properties at high temperatures ($t(\text{Curie}) = 590^\circ\text{C}$). The magnetomechanical coupling k , resonance frequency f_p , and magnetostrictive constants λ and Λ of a 7.7-mm diameter ferrite 21 specimen were measured as a function of temperature in a furnace at the rate of 30° per hour. The maximum relative departure of these parameters from their value at 20°C are tabulated. The relative change in the frequency conversion as

Cord 1/2

ACCESSION NR: AP4000410

a function of frequency drift is given by

$$\frac{\Delta \gamma}{\gamma} \approx \frac{1}{\sqrt{1 + 4 \left(\frac{\Delta \nu}{\nu} \right)^2 Q^2}} - 1.$$

The results show that emission from ferrite 21 under optimum magnetization can be utilized in liquids up to 400C temperatures without change in properties. Increasing the temperature to 500C reduces the emissive power by one half. This drop can be reduced 20% by adjusting the excited generator frequency. Orig. art. has: 3 figures, 3 tables, and 1 formula.
